

# SILENT CONFERENCE

## THE MOST SURPRISING THING ABOUT SILENT CONFERENCES

Conferences, trade shows, and conventions are generally regarded as some of the most challenging audio environments in the event business. With echoing halls, boomy ballrooms, bleed from booths, and ambient crowd noise, the audio environment alone is a challenge. Add to this the high expectations of clients, presenters, and delegates, all of whom demand perfection from start to finish. In this context, the idea of adding wireless headphones for every event attendee is a daunting task, enough to strike fear into even the most seasoned audio engineer.

While the concept of a silent conference isn't new, past attempts were hindered by inferior equipment. A silent event necessitated expensive stage monitoring systems or repurposed "silent disco" headphones, most of which with only three available channels. There was no way to customize the channels either in advance or onsite, and when one or more channels became compromised due to interference, there was no way to fix it.

Knowing what we know about this seemingly impossible task, imagine the surprise of experiencing a silent event that not only met, but exceeded every expectation. Enter Silent Conference. By utilizing proprietary technology and manufacturing equipment designed specifically for the unique challenge of the conference world, they've managed to vastly improve the event experience for everyone involved.

*"It was like having a personal conversation with every member of the audience. If only every talk I did meant I could engage the audience in the same way."*

**- Keynote Speaker, Veterinary Industry**

*"The headphones help us ensure that our visitors can hear clearly, particularly in our open theatres - A perfect solution for our events!"*

**- Events Manager, Mash Media Group**

The Silent Conference wireless headphone system offers pristine audio quality, and over 30 fully customisable and programmable HD stereo channels. Unlike other wireless headphone providers, Silent Conference technicians work with production teams to map and program the dozens of frequencies in advance, and can even reprogram their equipment to overcome unforeseen challenges. Attendees immerse themselves in presentations on the headphones, negating the need for loudspeakers, monitors, and the associated bleed they bring. Large ballrooms can be divided into multiple breakout sessions, providing a more economical solution that lowers cost and downtime. Without the distracting ambient chatter of a traditional conference, trade show, or convention, attendees fully focus on the experience, leading to improved information retention and engagement.

*"For the first time all our employees around the world were able to attend the same event and fully engage with the message simultaneously."*

**- Conference Organizer, Intl. Bank**

*"Hosting four speakers inside our busy trade halls meant we didn't have to book extra breakout rooms. Keeping everything together boosted the atmosphere."*

**- Event Organizer, Leading Supplier of Sanitary Ware**

While the concept of a silent event has been previously regarded as an unnecessary headache for A/V companies, Silent Conference is raising the bar and disrupting the event industry with their unique methodology. With over 20 years experience in event production, they have the ability to work seamlessly with clients and provide a range of support including lead producer, white-label vendor, or dry-hire rental house.
